Convio Web Services Release 1.5

Version 1.5 of Convio Web Services is now available!

Please see release notes below for further details on what is included in this release.

Release Notes

Defects addressed in this release include:

40302	The query 'select AdditionalDonation from ProductOrder' returns "An unexpected server error occurred while handling the request."
40478	The query 'select PromotionCode from DonationLevel' returns "An unexpected server error occurred while handling the request."

New Sample Application in VisualStudio.NET and Java

This release includes a sample application in both C# for VisualStudio.NET and Java for Apache Axis, which demonstrates the use of the Convio Web Services API. This application allows you to:

- Log in and establish a session with Convio Web Services
- Upload constituent records from a CSV-format file
- Download new constituent records
- Download updated constituent records
- Download new donation transactions

The application demonstrates different query techniques for selecting records to synchronize.

Download the sample application for VisualStudio.NET.

Download the sample application for Java.

New Sample XML Project File for SoapUI tool

With this sample project file, you can use the soapUI tool from eviware to demonstrate much of the functionality available through Convio Web Services.

From the soapUI 'File' menu, select 'Import Project'. In the dialog, browse to the location where you saved the project and select the file: "Convio_Web_Services-soapui-project.xml" Once the Project file is loaded and the Endpoint and WSDL definition are configured to refer to your Convio Web Services instance, you can use the tool to run test suites to illustrate each sample request.

Download the XML Project File.

Online Documentation

With this release, Convio Web Services Documentation is now available on the Convio Open web site.
